

## Part 2: Data Science & Analytics

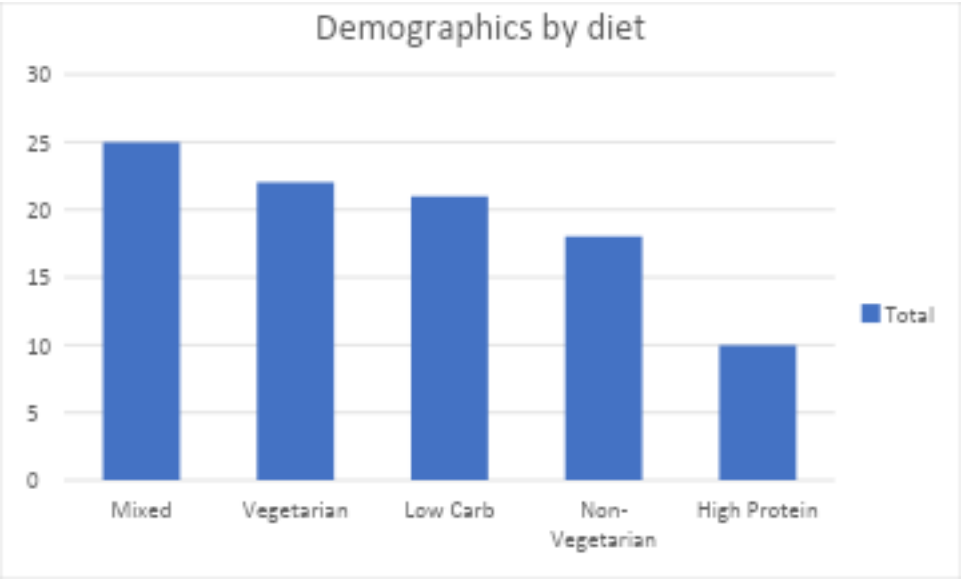

### Key findings:

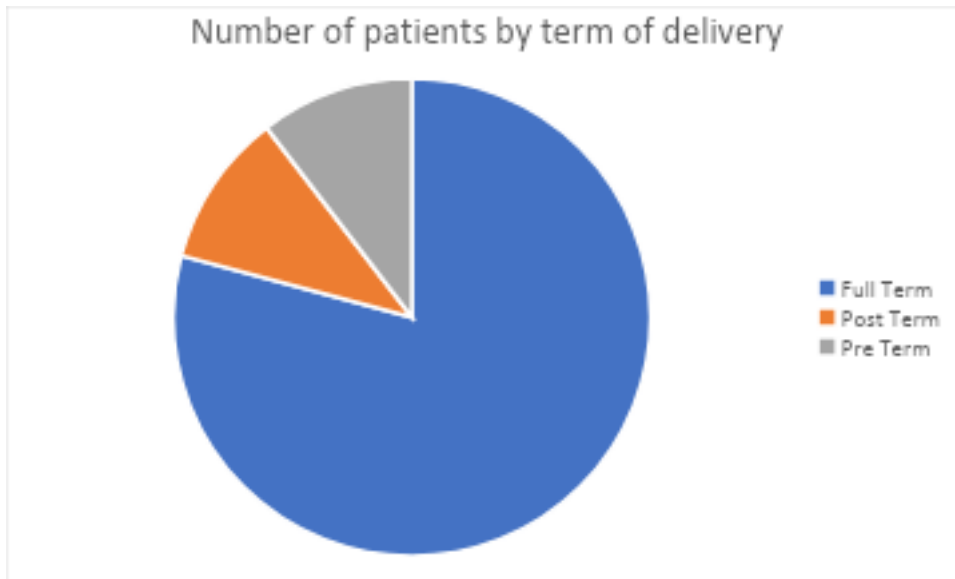

1. From our analysis we found Sindhudurgh has highest average age of first pregnancy, which indicates females from this district are more prone to get health risks at early age

2. Kankavil has highest total income, indicating more revenue from this region

3. Patients are more prone to mix diet and very few actually intake protein diet, which could cause health risk related to protein deficiency

4. Patients are more prone to be admitted at full term during pregnancy. Which is beneficial for the hospital to generate revenue. Doctors should recommend the patients to admit for full term.
